GARO signs five-year framework agreement with the Swedish Transport Administration

GARO has signed a five-year framework agreement with the Swedish Transport Administration (Trafikverket) for the supply of low-voltage connection equipment to Sweden's railway infrastructure. The total contract value amounts to approximately SEK 50 million over the contract period.

The agreement covers deliveries of connection equipment used in Trafikverket's railway facilities across the country. The product range includes, among other things, fuse and distribution enclosures as well as junction boxes—components that play a central role in ensuring the safe and reliable operation of the railway network's electrical systems.

"Being entrusted to supply the Swedish Transport Administration is significant for us. It demonstrates that GARO meets the high requirements for quality, delivery capability, safety and sustainability demanded in a sector operating in challenging environments," says Ekber Sjerotanovic, Area Sales Manager at GARO.

The products are designed to meet the stringent technical specifications required in sectors such as railways, where reliability, safety and long-term performance are essential to ensure infrastructure functionality over time.

The framework agreement is valid for five years, with deliveries taking place continuously throughout the contract period.
